# The problem

- **Variational Inference**

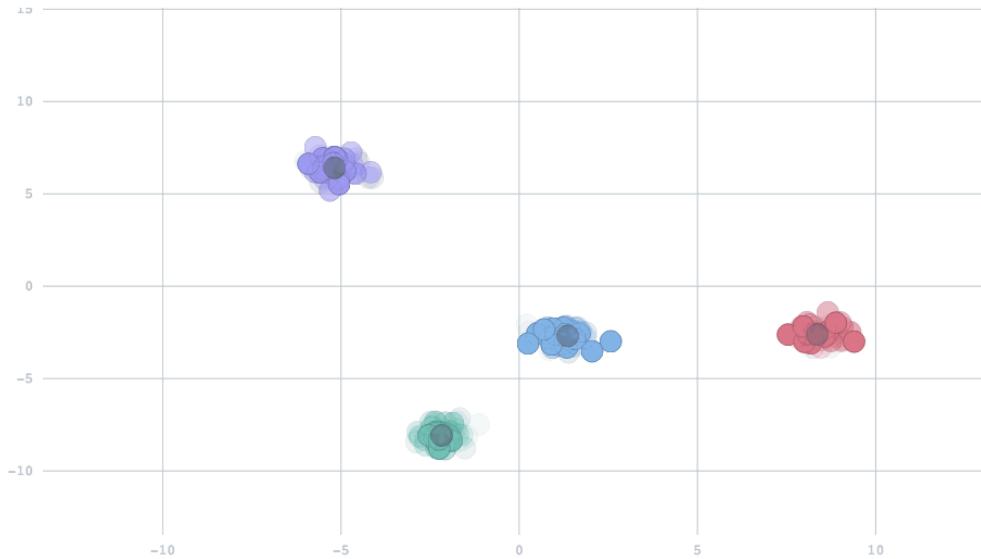

- Latent Variable Models (LVMs).
- Conjugate Exponential Family (CEF).

Winn & Bishop, 2005 Hoffman et al., 2013

# THE PROBLEM

Freeman J. Introducing streaming k-means in Apache Spark 1.2.

<https://databricks.com/blog/2015/01/28/introducing-streaming-k-means-in-spark-1-2.html>

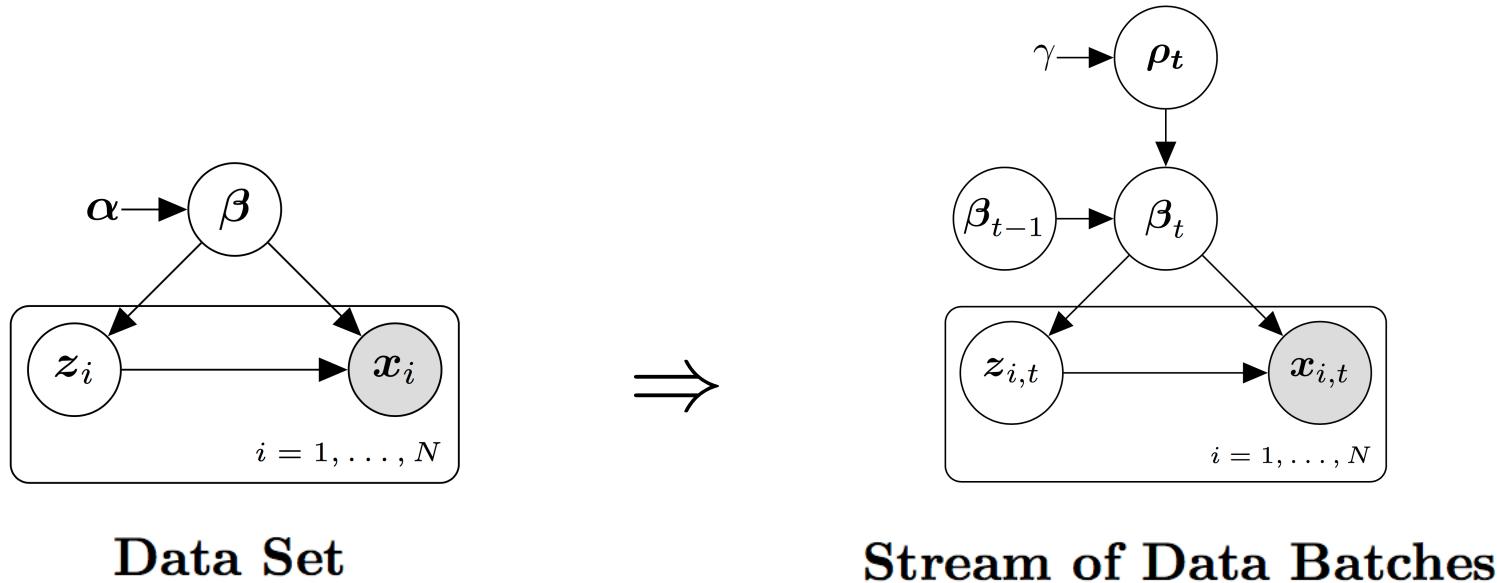

- **Learning from Data Streams**

- Continuous Model Updating.
- Bayesian posterior conditioned to non-finite data set.
- Presence of Concept Drift (i.e. non i.i.d data).

Gama et al., 2014

# Our proposal

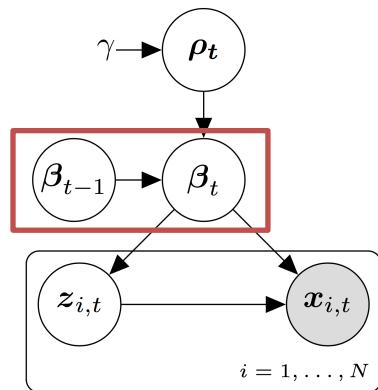

- **Out-of-the-box temporal extension.**
  - Global parameters  $\beta_t$  evolve over time.
  - Hierarchical prior modeling concept drift.
  - Closed-form Variational inference.

# Implicit Transition Models

Kárný (2014) and Özkan et al. (2013)

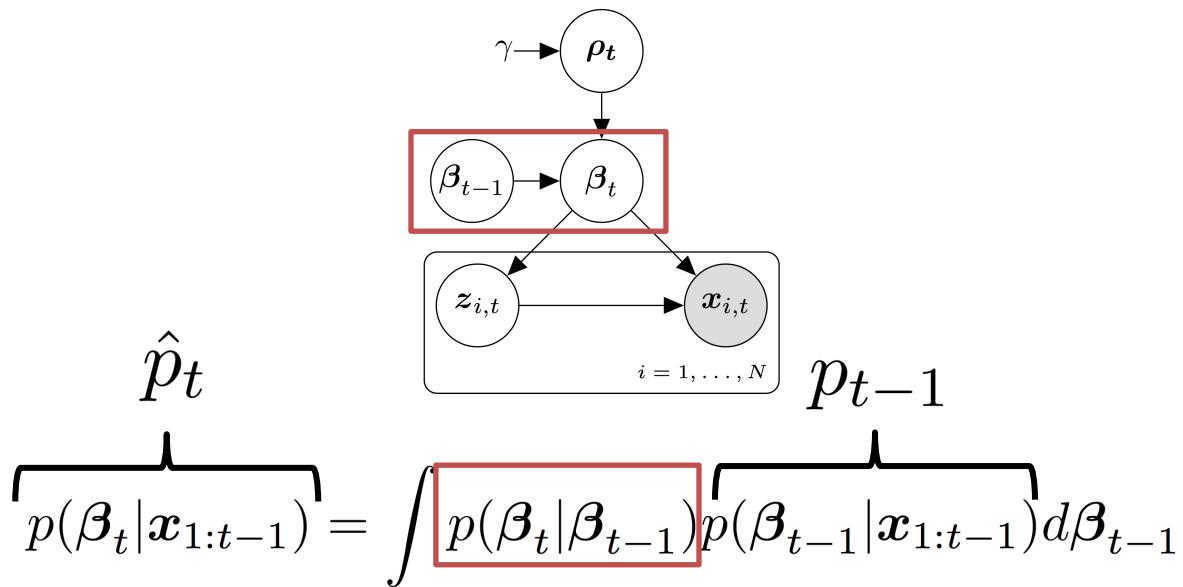

$$p(\boldsymbol{\beta}_t | \mathbf{x}_{1:t-1}) = \int p(\boldsymbol{\beta}_t | \boldsymbol{\beta}_{t-1}) p(\boldsymbol{\beta}_{t-1} | \mathbf{x}_{1:t-1}) d\boldsymbol{\beta}_{t-1}$$

- **Explicit Transition Models**

- Stationary transition model with requires domain knowledge.
- Outside conjugate exponential family.

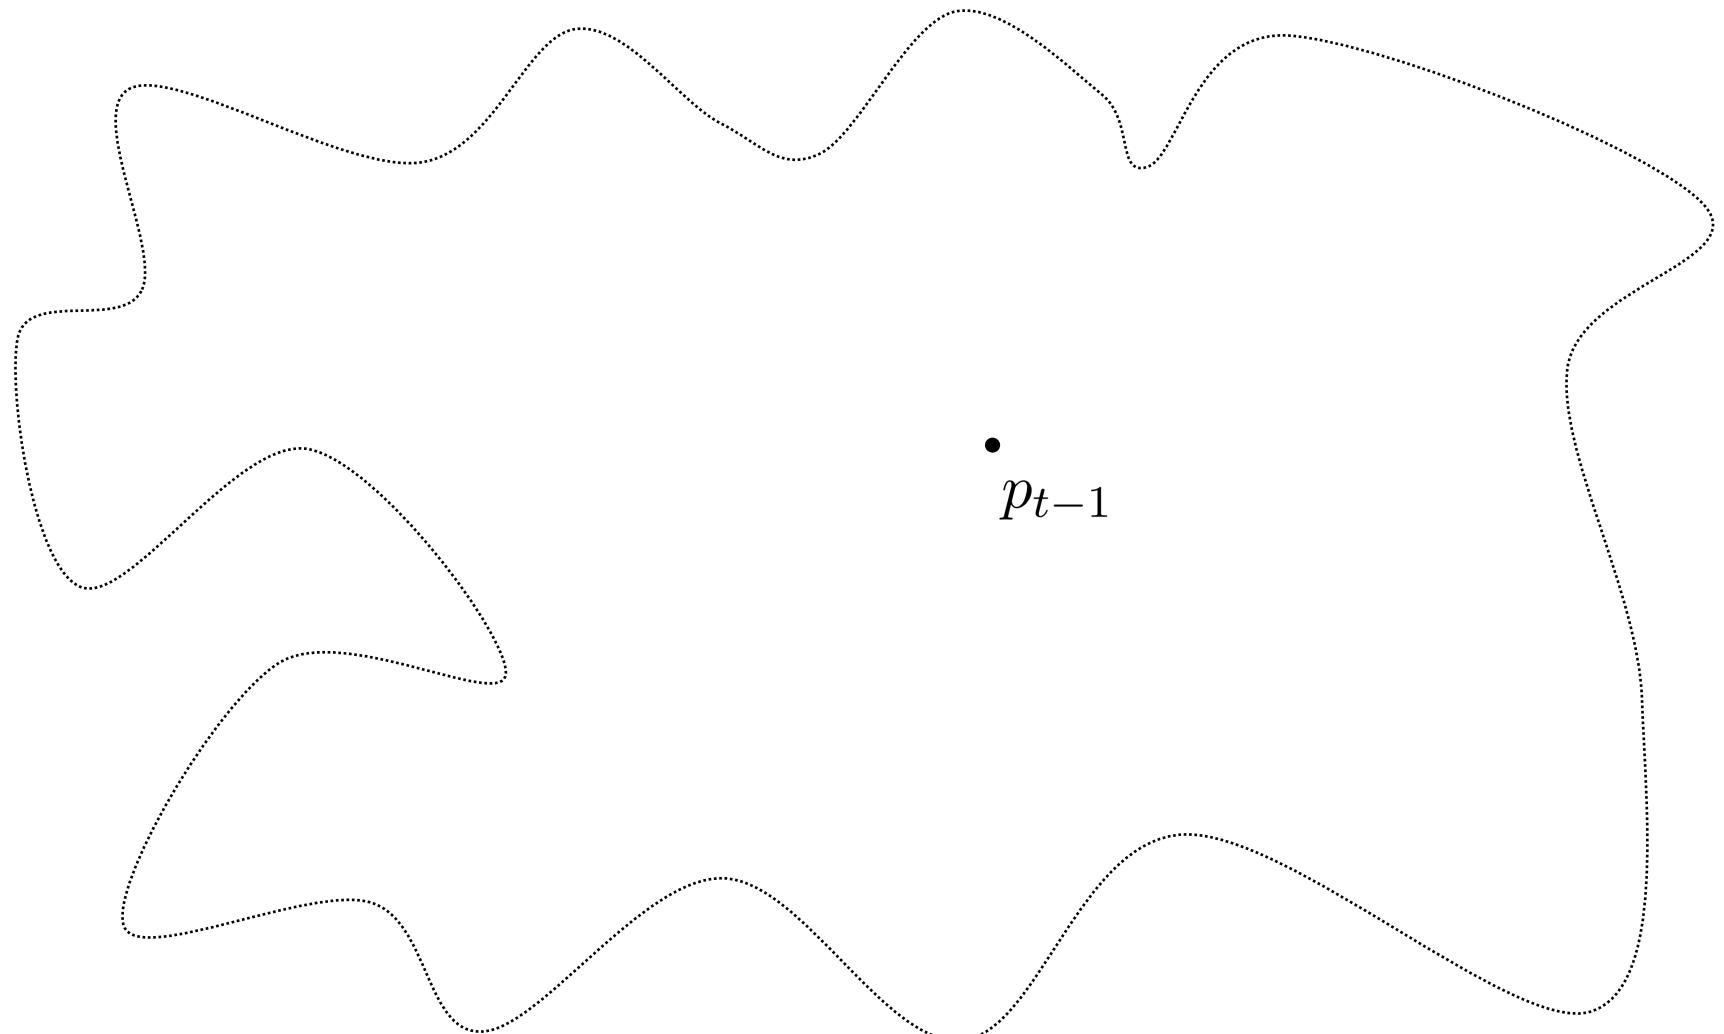

- **Explicit Transition Models**

- Stationary transition model with requires domain knowledge.
- Outside conjugate exponential family.

# IMPLICIT TRANSITION MODELS

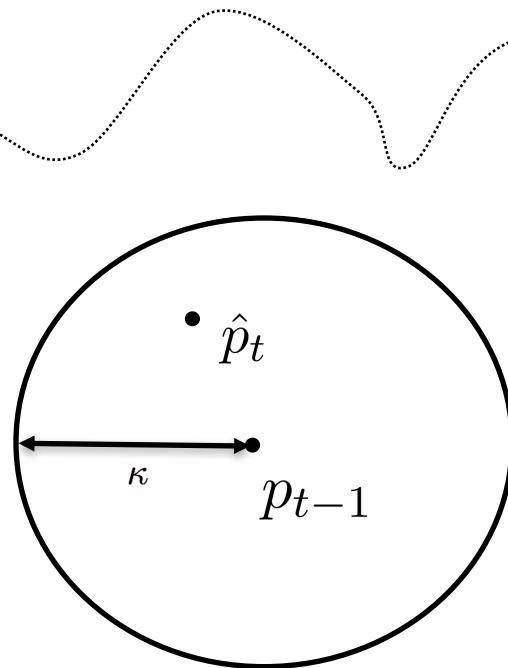

Λ M i D S T  
TOOLBOX

Kárný (2014) and Özkan et al. (2013)

# IMPLICIT TRANSITION MODELS

ΛΜ i D S T  
TOOLBOX

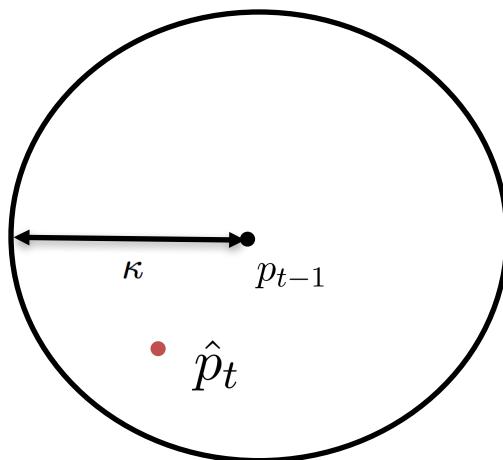

$$KL(\hat{p}_t, p_{t-1}) \leq \kappa$$

Kárný (2014) and Özkan et al. (2013)

# IMPLICIT TRANSITION MODELS

ΛΜ i D S T  
TOOLBOX

$$\hat{p}_t = \arg \max_{\hat{p}} H(\hat{p})$$

$$KL(\hat{p}_t, p_{t-1}) \leq \kappa$$

Kárný (2014) and Özkan et al. (2013)

$$\hat{\lambda}_t = (1 - \rho)\lambda_u + \rho\lambda_{t-1}$$

- **Closed-form solution for the Exponential Family**

- $\lambda$  natural parameter vector.
- $\rho \in [0, 1]$  is defined by the user.
- $\rho = 1$  equals  $\kappa = 0$  (i.e. maintain all the past data).
- $\rho = 0$  equals  $\kappa = \infty$  (i.e. completely forget past data).

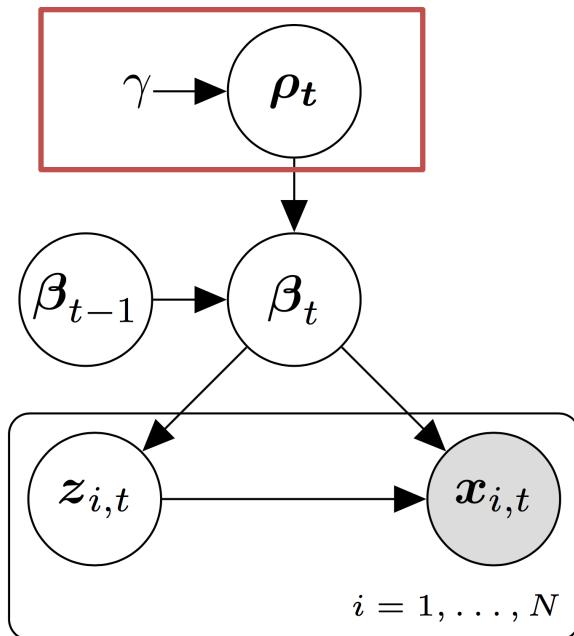

Kárný (2014) and Özkan et al. (2013)

# How to choose $\rho$ ?

- $\rho$  defines the degree of forgetting.
- Optimal  $\rho$  is time dependent.

# Hierarchical Power Priors

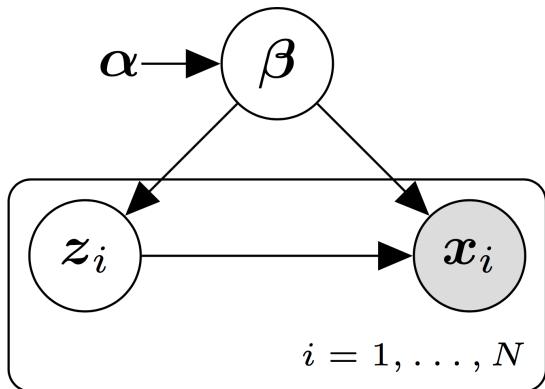

- $\rho_t \sim TruncatedExponential(\gamma), \Omega(\rho_t) = [0, 1]$ .
  - $\rho_t$  close to 1  $\rightarrow$  No Drift at time  $t$  (i.e.  $\beta_{t-1} \approx \beta_t$ ).
  - $\rho_t$  close to 0  $\rightarrow$  Drift at time  $t$  (i.e.  $\beta_{t-1} \not\approx \beta_t$ ).
- $p(\rho_t | \mathbf{x}_{1:t})$  tracks concept drift.

# Variational Inference with HPPs

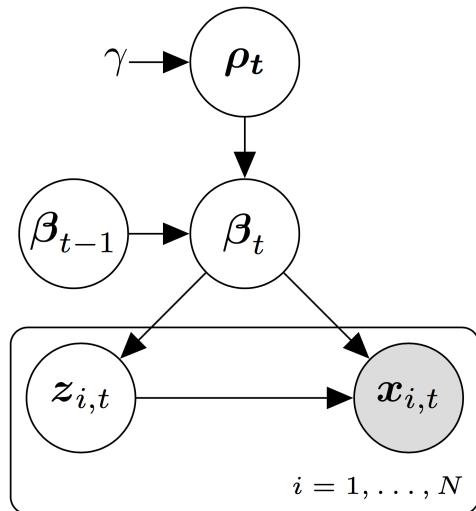

$$q(\boldsymbol{\beta}, \mathbf{z} | \boldsymbol{\lambda}, \boldsymbol{\phi}) = \prod_{k=1}^M q(\beta_k | \lambda_k) \prod_{i=1}^N \prod_{j=1}^J q(z_{i,j} | \phi_{i,j})$$

- **Variational Inference in plain LVMs**

- $(\boldsymbol{\lambda}^*, \boldsymbol{\phi}^*) = \arg \max_{\boldsymbol{\lambda}, \boldsymbol{\phi}} \mathcal{L}(\boldsymbol{\lambda}, \boldsymbol{\phi} | \mathbf{x}, \boldsymbol{\alpha})$
- Closed-form gradients for CEF models.

Winn & Bishop, 2005 Hoffman et al., 2013

$$q(\boldsymbol{\beta}_t, \boldsymbol{z}_t, \rho_t | \boldsymbol{\lambda}_t, \boldsymbol{\phi}_t, \omega_t)$$

- **Variational Inference in temporal LVMs**

- $(\boldsymbol{\lambda}_t^*, \boldsymbol{\phi}_t^*, \omega_t^*) = \arg \max_{\boldsymbol{\lambda}_t, \boldsymbol{\phi}_t, \omega_t} \mathcal{L}_{HPP}(\boldsymbol{\lambda}_t, \boldsymbol{\phi}_t, \omega_t | \mathbf{x}_t, \boldsymbol{\lambda}_{t-1})$
- **No closed-form gradients.**

$$\mathcal{L}_{HPP} \geq \hat{\mathcal{L}}_{HPP}$$

- A double-lower bound

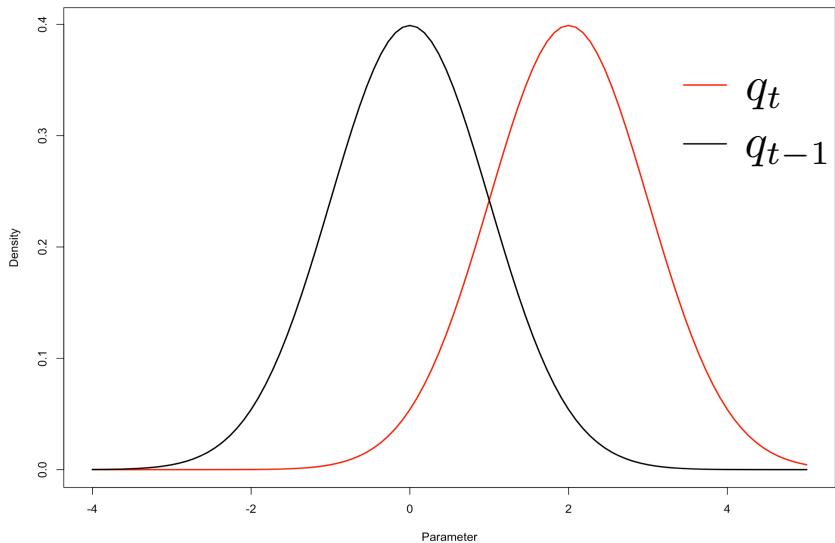

- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \boldsymbol{\lambda}_t} = \frac{\partial \mathcal{L}}{\partial \boldsymbol{\lambda}}$       with  $\boldsymbol{\alpha} = (1 - E_q[\rho_t])\boldsymbol{\lambda}_u + E_q[\rho_t]\boldsymbol{\lambda}_{t-1}$
- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \boldsymbol{\phi}_t} = \frac{\partial \mathcal{L}}{\partial \boldsymbol{\phi}}$

- **Closed-form gradient**

- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \omega_t} = KL(q_t, p_u) - KL(q_t, q_{t-1}) + \gamma - \omega_t.$
- A measure of concept drift.

# Drift

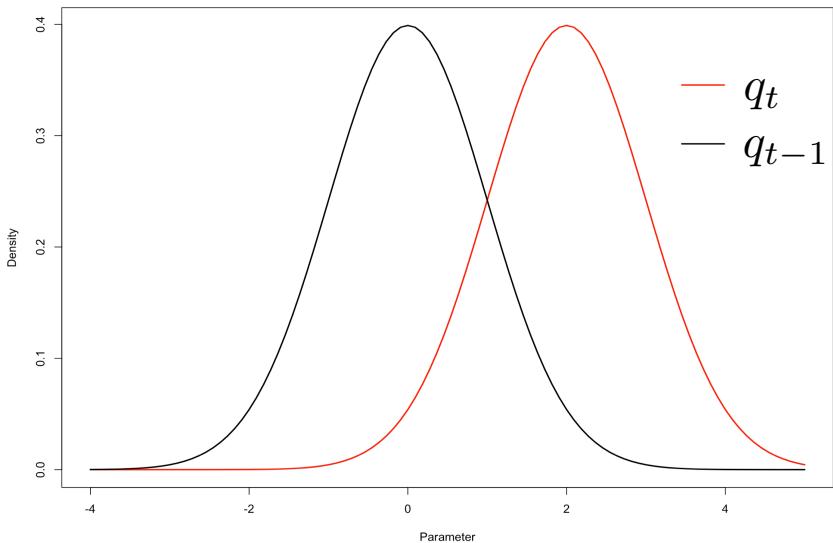

$$KL(q_t, p_u) + \gamma < KL(q_t, q_{t-1})$$

- **Closed-form gradient**

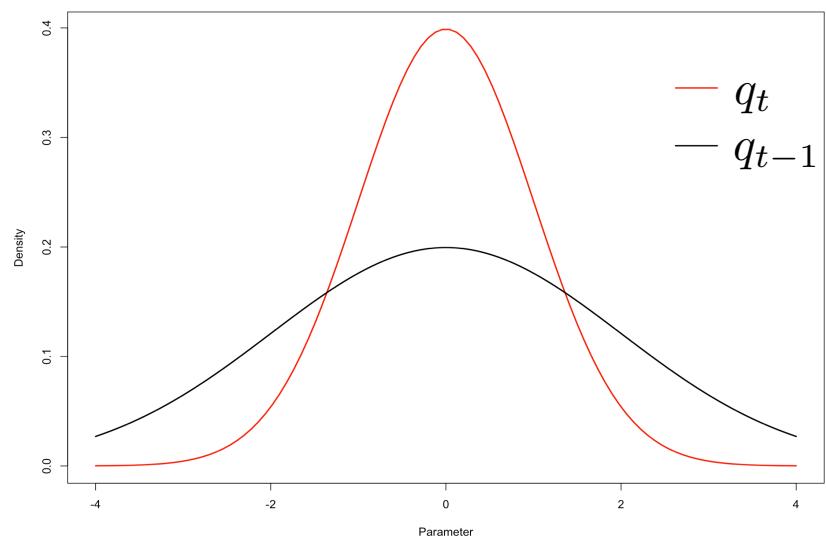

- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \omega_t} = KL(q_t, p_u) - KL(q_t, q_{t-1}) + \gamma - \omega_t.$
- A measure of concept drift.

## Drift

$$KL(q_t, p_u) + \gamma < KL(q_t, q_{t-1})$$

## No Drift

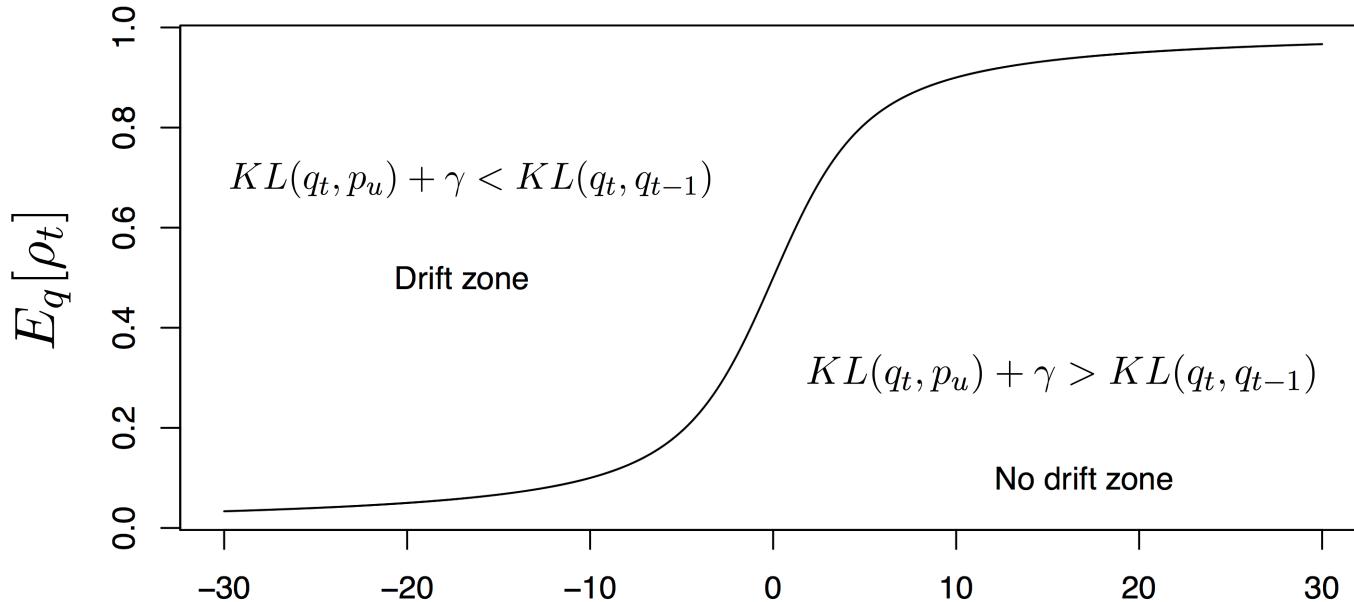

$$KL(q_t, p_u) + \gamma > KL(q_t, q_{t-1})$$

- **Closed-form gradient**

- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \omega_t} = KL(q_t, p_u) - KL(q_t, q_{t-1}) + \gamma - \omega_t.$
- A measure of concept drift.

- **Closed-form gradient**

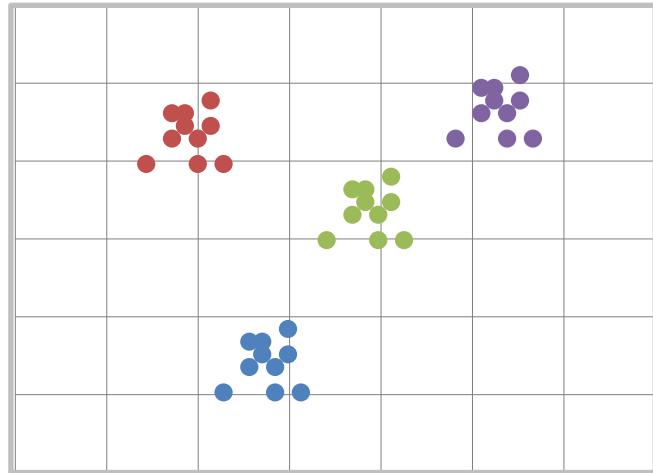

- $\frac{\partial \hat{\mathcal{L}}_{HPP}}{\partial \omega_t} = KL(q_t, p_u) - KL(q_t, q_{t-1}) + \gamma - \omega_t.$
- A measure of concept drift.

What if only part of  
the data drifts?

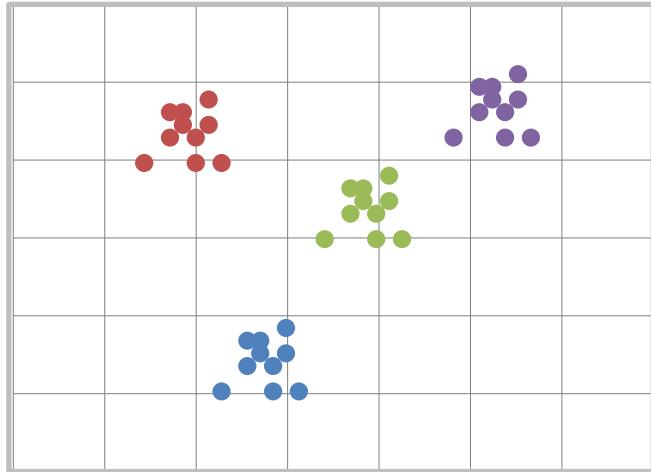

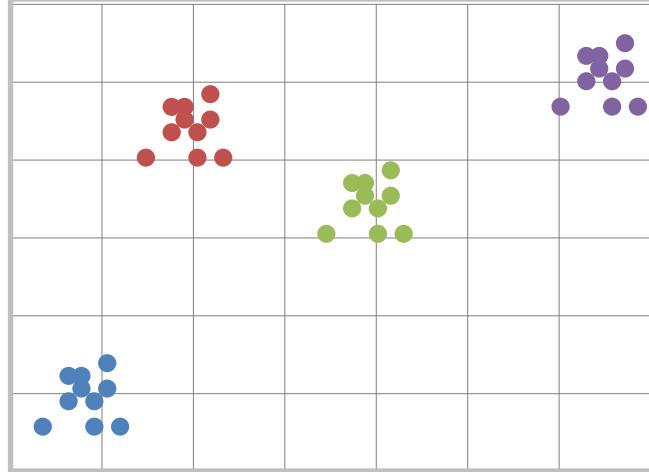

# MULTIPLE HPPS

ΛΜ i DST  
TOOLBOX

$\mathbf{x}_{t-1}$

 $\mathbf{x}_{t-1}$  $\mathbf{x}_t$ 

- **Multiple HPPs**

- Place independent  $\rho_{k,t}$  for each parameter of the model.
- Closed-form Variational inference.

# Experimental Evaluation

# EXPERIMENTAL EVALUATION

## • Summary of the evaluation:

- M-HPP is the most robust approach.
- Adaptive forgetting mechanisms are usually needed.
- Concept drift usually affects only a part of the model.

# COME TO MY POSTER @ GALLERY #37

**Bayesian Models of Data Streams**  
with Hierarchical Power Priors

Andres R. Masegosa<sup>(1)</sup>, Thomas D. Nielsen<sup>(2)</sup>, Helge Langseth<sup>(3)</sup>, Dario Bonsu-Lopez<sup>(1)</sup>, Antonia Salmeron<sup>(1)</sup>, Anders L. Hadsse<sup>(2,4)</sup>  
(1) University of Alberta [CA], (2) University of Aalborg [DK], (3) Norwegian University of Science and Technology [NO], (4) Hugin Experts A/S [DK]

## The problem

- Variational Inference
  - Latent Variable Models (LVMs).
  - Conjugate Exponential Family (CEF).
- Learning from Data Streams
  - Continuous Model Updating.
  - Bayesian posterior conditioned to non-finite data set.
  - Presence of Concept Drift (i.e. non i.i.d. data).

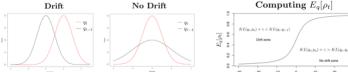

## Implicit Transition Models

$$\begin{aligned} \hat{p}_t &= \int p(\beta_t | \beta_{t-1}) p(\beta_{t-1} | x_{1:t-1}) d\beta_{t-1} \\ &= \int p(\beta_t | \beta_{t-1}) p(\beta_{t-1} | x_{1:t-1}) d\beta_{t-1} \end{aligned}$$

$$\hat{\lambda}_t = (1 - \rho)\lambda_t + \rho\lambda_{t-1}$$

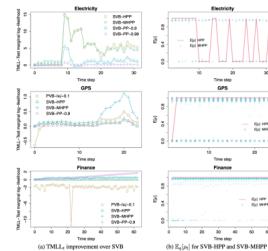

## Variational Inference with Hierarchical Power Priors

- A double-lower bound
  - $\frac{\partial \mathcal{L}_{HPP}}{\partial \beta} = \frac{\partial \mathcal{L}}{\partial \beta}$  (i.e. computed in closed-form).
  - $\frac{\partial \mathcal{G}_{HPP}}{\partial \phi} = \frac{\partial \mathcal{G}}{\partial \phi}$  (i.e. computed in closed-form).

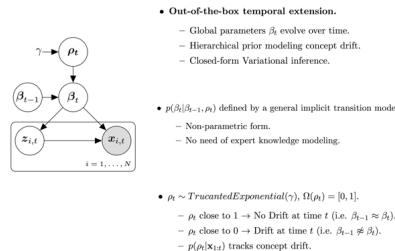

- Closed-form gradient
  - $\frac{\partial \mathcal{L}_{HPP}}{\partial \phi} = KL(p_t, p_{t-1}) - KL(p_t, \phi_{t-1}) + \gamma - \omega_t$
  - A measure of concept drift.
- If only part of the data drifts
  - Multiple Hierarchical Power Priors (M-HPP).
  - Place independent  $\rho_{t,i}$  for each parameter of the model.
  - Closed-form Variational inference.

## Experimental Evaluation

## Our proposal

- Out-of-the-box temporal extension.
  - Global parameters  $\beta_t$  evolve over time.
  - Hierarchical prior modeling concept drift.
  - Closed-form Variational inference.
- $p(\beta_t | \beta_{t-1}, \rho_t)$  defined by a general implicit transition model.
  - Non-parametric form.
  - No need of expert knowledge modeling.
- $\rho_t \sim TruncatedExponential(\gamma)$ ,  $\Omega(\rho_t) = [0, 1]$ .
  - $\rho_t$  close to 1  $\rightarrow$  No Drift at time  $t$  (i.e.  $\beta_{t-1} \approx \beta_t$ ).
  - $\rho_t$  close to 0  $\rightarrow$  Drift at time  $t$  (i.e.  $\beta_{t-1} \neq \beta_t$ ).
  - $p(\rho_t | x_{1:t})$  tracks concept drift.

## Variational Inference

- Variational Inference in plain LVMs
  - $(\lambda^*, \phi^*) = \arg \max_{\lambda, \phi} \mathcal{L}(\lambda, \phi | \mathbf{x}, \alpha)$
  - Closed-form gradients for CEF models.
- Variational Inference in temporal LVMs
  - $(\lambda^*, \phi^*, \omega_t^*) = \arg \max_{\lambda, \phi, \omega} \mathcal{L}_{HPP}(\lambda_t, \phi_t, \omega_t | \mathbf{x}, \lambda_{t-1})$
  - No closed-form gradients.

# Thanks for your attention
